

Abstract Of The Disclosure

In one embodiment of the invention, there is disclosed an electrical connector connectable to a printed circuit board on one end, which includes an insulative housing and a plurality of insulative posts disposed in the insulative housing, with the insulative posts arranged in at least one row. Each of the insulative posts has a first side and a second side, and the insulative posts extend in a direction away from the printed circuit board. A plurality of signal conductors are provided, with each signal conductor having a first contact end connectable to the printed circuit board, a second contact end, and an intermediate portion therebetween that is disposed in the insulative housing, wherein the signal conductors are disposed along the first side of the insulative posts. A plurality of ground conductors are provided, with each ground conductor having a first contact end connectable to the printed circuit board, a second contact end, and an intermediate portion therebetween that is disposed in the insulative housing, wherein the ground conductors are disposed along the second side of the insulative posts such that the signal conductors and the ground conductors are electrically isolated from one another.
